

WHITE PAPER: THE CARE GOVERNANCE DEFICIT

Transforming Social Policy into Auditable Care Metrics in Low- and Middle-Income Countries (LMICs)

Prepared by: CareBridge'07 Dynamic Global Ltd (RC: 8734346 | Nigeria)

Author: Ayomide Idris Sanni, MSW (Founder & Managing Director, CareBridge'07 Dynamic Global Ltd)

Executive Summary

Across much of the developing world, social protection systems are entering a period of unprecedented strain. Population ageing is accelerating, urban migration continues to separate families, traditional care networks are weakening, and public institutions remain inadequately prepared to respond. The result is an expanding governance vacuum affecting millions of older persons and other vulnerable populations.

Historically, governments relied heavily on informal family structures to deliver care. This arrangement functioned as a de facto welfare system requiring little direct state investment. Today, demographic realities have fundamentally altered that equation. Increased life expectancy, labour migration, declining household sizes, economic pressures, and rising dependency ratios have exposed the limitations of a care model built almost entirely upon unpaid family labour.

The consequence is what this paper defines as the **Care Governance Deficit**—a systemic condition in which institutions lack the mechanisms necessary to:

- Measure dignity-centred care outcomes;
- Verify service quality and institutional accountability;
- Monitor caregiver burden and resilience;
- Detect abuse, neglect, and social isolation;
- Allocate resources efficiently and equitably; and
- Generate actionable, real-time policy intelligence.

In the absence of measurable indicators, human dignity remains an aspirational principle rather than an operational governance objective. Simply stated:

"What cannot be measured cannot be effectively governed."

CARE GOVERNANCE ARCHITECTURE (CGA) VISUAL FRAMEWORK

CARE GOVERNANCE ARCHITECTURE

The Care Governance Architecture (CGA)

To address this structural deficit, this white paper introduces the Care Governance Architecture (CGA)—an integrated framework that transforms social protection from a reactive, charity-driven model into an evidence-based system of measurable accountability.

The CGA provides governments, development agencies, and care institutions with practical tools to:

- Assess vulnerability;
- Monitor care quality;
- Strengthen institutional accountability;
- Predict systemic risks; and
- Generate actionable policy intelligence.

At the centre of this architecture is the **Geriatric Dignity Index (GDI)**—a multidimensional composite metric designed to evaluate care quality across five interconnected domains:

1. **Structural Autonomy:** Measures an individual's ability to maintain control over daily routines, personal preferences, and environmental choices.
2. **Preserved Voice and Executive Agency:** Evaluates participation in decision-making, financial autonomy, and the preservation of legal and personal rights.
3. **Psychosocial Legacy and Identity Integration:** Assesses social connectedness, cultural continuity, memory preservation, and identity affirmation.
4. **Protection and Fundamental Security:** Measures safeguarding systems, protection from abuse and neglect, and the safety of physical environments.
5. **Communitarian Participation:** Examines integration within community, intergenerational relationships, and opportunities for civic and social engagement.

Together, these dimensions translate abstract human rights principles into measurable

administrative indicators capable of informing:

- Budget allocations;
- Institutional audits;
- Programme evaluations;
- Monitoring and Evaluation (M&E) systems;
- Public policy reforms; and
- Social protection financing mechanisms.

Scalable Ecosystem of Complementary Indices

The Care Governance Architecture extends beyond older adult care and establishes a scalable ecosystem of complementary governance metrics:

- **Geriatric Dignity Index (GDI):** Measures dignity-centred outcomes for older persons and institutional care systems.
- **Developmental Agency Index (DAI):** Measures educational safety, anti-bullying effectiveness, and child safeguarding infrastructure.
- **Disability Inclusion Index (DII):** Measures accessibility, participation, and institutional inclusion for persons with disabilities.
- **Caregiver Resilience Index (CRI):** Measures economic, psychological, and operational resilience among formal and informal caregivers.
- **Community Protection Index (CPI):** Measures social vulnerability, displacement risks, and community protection capacities.

Collectively, these indices constitute a next-generation Care Governance Architecture (CGA) capable of generating real-time policy intelligence through:

- Mobile data collection;
- Digital dashboards;
- Standardized field instruments;
- Geographic vulnerability mapping;
- Predictive analytics; and
- AI-assisted decision-support systems.

Target Applications

The framework is specifically designed for implementation within low-resource environments and can support:

- **Governments:** National Governments, State and Local Governments, Municipal Authorities.
- **Ministries and Public Institutions:** Ministries of Health, Ministries of Social Welfare, Ministries of Education, National Senior Citizens Agencies, Child Protection Agencies.
- **Development Partners:** World Bank, African Development Bank (AfDB), UNICEF, UNDP, International NGOs, Bilateral Development Agencies.
- **Academic and Research Institutions:** Universities, Public Policy Schools, Gerontology Research Centres, Social Work Faculties, Public Health Institutions.
- **Service Providers:** Community-Based Organisations, Faith-Based Organisations, Home-Care Agencies, Social Enterprises, Humanitarian Organisations.

Central Argument

The central proposition of this white paper is both simple and transformative:

Human dignity should no longer exist merely as a moral aspiration or legal declaration. It must become an auditable governance asset—one that can be measured, verified, financed, monitored, and defended through evidence-based public policy.

The future of social protection will not be defined by goodwill alone. It will be determined by the capacity of institutions to convert:

- Compassion into Systems
- Rights into Metrics
- Care into Measurable Outcomes
- Vulnerability into Actionable Intelligence
- Policy Intentions into Verifiable Results

The Care Governance Deficit therefore presents not merely a critique of existing welfare systems, but a practical blueprint for the next generation of social governance in Low- and Middle-Income Countries (LMICs)—a transition:

- From Charity to Accountability;
- From Assumptions to Evidence;
- From Fragmented Interventions to Integrated Systems;
- From Reactive Responses to Predictive Governance; and
- From Invisible Vulnerabilities to Measurable Dignity-Centred Governance.

Keywords

Care Governance • Geriatric Dignity Index (GDI) • Developmental Agency Index (DAI) • Care Governance Architecture (CGA) • Social Protection • Ageing Policy • Public Administration • Governance Metrics • Human Dignity • GovTech • Social Innovation • Child Safeguarding • Public Health • Humanitarian Development • Low- and Middle-Income Countries (LMICs)

About CareBridge'07 Dynamic Global Ltd

CareBridge'07 Dynamic Global Ltd (RC: 8734346) is a Nigerian-based social innovation and GovTech enterprise dedicated to transforming human vulnerability into measurable governance intelligence. The organisation develops auditable care metrics, digital policy tools, and evidence-based frameworks that strengthen social protection systems across emerging economies.

Mission: Bridging Care. Restoring Dignity. Transforming Lives.
